20

CLAIMS

We claim:

5

1. A method of increasing throughput of a server capable of servicing at least one TCP/IP connection with a client, the server creating a TCP/IP Transmission Control Block (TCB) stored in non-paged pool (NPP) memory containing information required to identify and to service the client connection, comprising the steps of:

closing a TCP/IP connection;

excluding information from the TCB not required to identify the client connection to form a timed-wait state TCB (TWTCB) for a time-wait period; and

releasing the NPP memory containing the information required to service the client connection.

- 2. The method of claim 1, wherein the step of excluding comprises the step of copying the information required to identify the client connection to form the TWTCB.
- 3. The method of claim 2, wherein the step of releasing the NPP memory containing the information required to service the client connection includes the step of releasing the NPP memory of the TCB required to identify the client connection.
- 4. The method of claim 1, wherein the step of excluding information not required to identify the client connection to form a TWTCB comprises the step of maintaining a minimum of information necessary to avoid late-routed packets forming new connections on the server.

The method of claim 1, wherein the step of excluding information not 5. required to identify the client connection to form a TWTCB comprises the step of establishing a TWTCB of the following structure:

```
struct TWTCB {
    5
                      #ifdef DEBUG
                         ulong
                                    twtcb_sig;
                      #endif
                         struct TWTCB
                                         *twtcb next;
  10
                                                      // Destination IP address.
                         IPAddr
                                     twtcb daddr;
                                     twtcb dport;
                                                      // Destination port.
                         ushort
                                     twtcb sport;
                                                      // Source port.
                         ushort
                                     twtcb partition;
                         uint
口
近 15
                         ushort
                                     twtcb delta;
                                     twtcb rexmittimer;
                         ushort
                                     twtcb TWQueue; // Place to hold all the timed waits
                         Oueue
                         uint
                                     twtcb flags;
                                                      // Source IP address.
                                     twtcb saddr;
                         IPAddr

                                     twtcb sendnext;
                         SeqNum
                      #else
                         struct TWTCB
                                         *twtcb prev;
                       #endif
  25
                         SeqNum
                                      twtcb rcvnext;
                                      twtcb phxsum;
                                                        // Precomputed pseudo-header xsum.
                         uint
                         DEFINE LOCK STRUCTURE(twtcb lock)
                                      twtcb refcnt;
                         //ulong
  30
                         //SeqNum
                                      twtcb sendmax;
                                                     // State of this TCB.
                         //uchar
                                      twtcb state;
                                                          // RCE for this connection.
                         //RouteCacheEntry *twtcb rce;
                };
```

The method of claim 1, wherein the step of excluding information not 6. required to identify the client connection to form a TWTCB comprises the step of establishing a TWTCB of the following structure:

B37400.081100

35

```
09637400 081100
25
```

```
struct TWTCB {
                    #ifdef DEBUG
                      ulong
                              twtcb_sig;
                    #endif
 5
                      struct TWTCB *twtcb next;
                                                  // Destination IP address.
                      IPAddr twtcb daddr;
                                                 // Destination port.
                      ushort twtcb dport;
                                                 // Source port.
                      ushort twtcb sport;
                       ushort twtcb delta;
10
                      ushort twtcb rexmittimer;
                      IPAddr twtcb saddr;
                                                  // Source IP address.
                      //ulong twtcb_refcnt;
                      //SeqNum twtcb sendmax;
15
                                                // State of this TCB.
                      //uchar twtcb state;
                                                             // RCE for this connection.
                      //RouteCacheEntry
                                             *twtcb rce;
             };
```

- 7. The method of claim 1, wherein the step of excluding information not required to identify the client connection comprises the step of forming a TWTCB that occupies less memory than the TCB.
- 8. The method of claim 7, wherein the step of forming a TWTCB that occupies less memory than the TCB comprises the step of forming a TWTCB that occupies approximately 96 bytes of memory.
- 9. The method of claim 7, wherein the step of forming a TWTCB that occupies less memory than the TCB comprises the step of forming a TWTCB that occupies approximately 64 bytes of memory.

20

5

- 10. The method of claim 7, wherein the step of forming a TWTCB that occupies less memory than the TCB comprises the step of forming a TWTCB that occupies approximately a single cache line.
- 11. A method for increasing the throughput of a server capable of servicing at least one TCP/IP connection, the server establishing a TCP/IP Transmission Control Block (TCB) of a size and containing information sufficient to identify and service the connection, comprising the steps of:

closing the at least one TCP/IP connection; forming a Timed-Wait TCB (TWTCB) of a size less than the TCB; and releasing the TCB for use by the server.

- 12. The method of claim 11, wherein the step of forming a TWTCB comprises the step of copying a portion of the information of the TCB, the portion of information being sufficient to identify the TCP/IP connection to prevent late routed packets from forming new connections.
- 13. The method of claim 12, wherein the TCB occupies approximately 440 bytes of memory, and wherein the step of forming a TWTCB comprises the step of forming a TWTCB that occupies approximately 206 bytes of memory.

- 14. The method of claim 12, wherein the TCB occupies approximately 440 bytes of memory, and wherein the step of forming a TWTCB comprises the step of forming a TWTCB that occupies approximately 32 bytes of memory.
- The method of claim 11, wherein the step of forming a TWTCB comprises the step of forming a TWTCB having the following structure:

```
struct TWTCB {
                       #ifdef DEBUG
  10
                         ulong
                                     twtcb sig;
                       #endif
                         struct TWTCB
                                         *twtcb next;

                       #if 0 // TRIM TWTCBREMOVE
                         SeqNum
                                      twtcb sendnext;
                      #else
                         struct TWTCB
                                         *twtcb prev;
                      #endif
                                      twtcb rcvnext;
                         SeqNum
                                      twtcb phxsum;
                                                        // Precomputed pseudo-header xsum.
                         uint
                         DEFINE LOCK STRUCTURE(twtcb lock)
  30
                                      twtcb refcnt;
                         //ulong
                         //SeqNum
                                      twtcb sendmax;
                                      twtcb state;
                                                     // State of this TCB.
                         //uchar
                                                          // RCE for this connection.
                         //RouteCacheEntry *twtcb rce;
  35
               };
```

16. The method of claim 11, wherein the step of forming a TWTCB comprises the step of forming a TWTCB having the following structure:

```
struct TWTCB {
                    #ifdef DEBUG
 5
                      ulong
                              twtcb_sig;
                    #endif
                      struct TWTCB *twtcb next;
                                                  // Destination IP address.
                      IPAddr twtcb daddr;
                      ushort twtcb dport;
                                                 // Destination port.
10
                      ushort twtcb sport;
                                                // Source port.
                      ushort twtcb delta;
                      ushort twtcb rexmittimer;
                                                  // Source IP address.
                      IPAddr twtcb saddr;
15
                      //ulong twtcb refcnt;
                      //SeqNum twtcb sendmax;
                      //uchar twtcb state;
                                                // State of this TCB.
                      //RouteCacheEntry
                                                             // RCE for this connection.
                                             *twtcb rce;
20
             };
```

- 17. The method of claim 11, wherein the step of forming a TWTCB comprises the step of copying a portion of the information of the TCB, the portion of information being insufficient to service the TCP/IP connection.
- 18. A computer readable medium having computer-executable instructions for performing steps, comprising:

closing a TCP/IP connection;

osaveca callod

30

copying less than all information stored in a TCP/IP Transmission Control Block (TCB) into a Timed-Wait TCB (TWTCB); and

10

15

maintaining the TWTCB for a timed-wait period to avoid late-routed packets from establishing a new connection with a server.

- 19. The computer-readable medium of claim 18, wherein the step of copying less than all the information stored in a TCB into a TWTCB comprises the step of copying information sufficient to uniquely identify the TCP/IP connection.
 - 20. The computer-readable medium of claim 18, further comprising the step of releasing memory used to store the TCB for use by the server after the step of copying less than all of the information stored in the TCB into a TWTCB.
 - 21. The computer-readable medium of claim 18, wherein the step of copying less than all the information stored in a TCB into a TWTCB results in a structure for the TWTCB that fits on one cache line.
 - 22. A computer-readable medium having stored thereon a data structure, consisting essentially of:

```
struct TWTCB {
                    #ifdef DEBUG
20
                       ulong
                                   twtcb_sig;
                    #endif
                       struct TWTCB *twtcb next;
                                                     // Destination IP address.
                      IPAddr
                                    twtcb daddr;
                                   twtcb dport;
                                                     // Destination port.
                       ushort
25
                                   twtcb sport;
                                                    // Source port.
                       ushort
                                   twtcb_partition;
                       uint
                                   twtcb delta;
                       ushort
                       ushort
                                   twtcb rexmittimer;
```

```
twtcb TWQueue; // Place to hold all the timed waits
                      Queue
                                  twtcb flags;
                      uint
                                  twtcb saddr;
